SCORE OVER LENGTH SEARCHES

Attached is a score over length search. This search was developed to overcome limitations in most standard search systems which favor large sequences with high scoring, but lesser overall identity over smaller sequences with higher overall identity. This search is especially useful for relatively small nucleic acid or polypeptide target sequences (antisense, fragments, probes, primers, RNAi, epitopes, haptens, etc.) claimed functionally via a form of hybridization and/or identity language and having defined upper and lower polynucleotide and or polypeptide length limits.

The score over length search is performed by first running the query sequence using examiner-specified identity and polynucleotide or protein length limit parameters, and saving 65,000 hits and 0 alignments from each desired database. The resulting output is reformatted using a Microsoft Word macro and is imported into Excel. The summary table data are then sorted by the ratio of score of each hit sequence divided by its length and the accession numbers for all hits below the examiner's desired score over length parameters are deleted. The remaining accession numbers are used to pull the corresponding sequences from the databases into subdatabases enriched for good hits and the query sequence is re-run against these subdatabases to yield the final results.

The score over length cutoff for this search is 75%.

Examiner Please Note: This cover sheet should be included when submitting results to be scanned.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov
Series: IRAK Plate: 113 Row: k Column: 5
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis
This clone has the following problem: no 5' EST match.

COMMENT cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues.
Cells were provided by Hiroo Iwata (Department of Reparative Materials Field of Tissue Engineering Institute for Frontier Medical Sciences,Sakyo-ku,Kyoto,606-8507,Japan) whose assistance we gratefully acknowledge.
Please visit our web site for further details.

TITLE Direct Submission
JOURNAL Submitted (18-AUG-2000) Yoshihide Hayashizaki, The Institute of Physical and Chemical Research (RIKEN), Laboratory for Genome Exploration Research Group, RIKEN Genomic Sciences Center (GSC), RIKEN Yokohama Institute; 1-7-22 Suehiro-cho, Tsurumi-ku, Yokohama, Kanagawa 230-0045, Japan (E-mail:genome-res@gsc.riken.jp, URL:http://genome.gsc.riken.jp/, Tel:81-45-503-9222, Fax:81-45-503-9216)
COMMENT On Dec 10, 2002 this sequence version replaced gi:12859956.
Please visit our web site (http://genome.gsc.riken.jp/) for further details.
cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. First strand cDNA was primed with a primer [5' GAGAGAGAGAAGGATCCAAGAGCTCTTTTTTTTTTTTTTTTVN 3'], cDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. Second strand cDNA was prepared with the primer adapter of sequence [5' GAGAGAGAGATTCTCGAGTTAATTAAATTAATCCCCCCCCCCCCC 3']. cDNA was cleaved with BamHI and XhoI. cDNA of size comprised longer than 7 kb was selected before cloning. Vector: a modified pBluescript KS(+) after bulk excision from Lambda FLC I. Cloning sites, 5' end: SalI; 3' end: BamHI. Host: DH10B.

XX
PS Claim 3; Fig 1; 15pp; Japanese.
XX
CC The sequence is that encoding an epidemic non-A, non-B hepatitis (NANBH)
CC virus antigen peptide. The peptide is useful for the detection of NANBH
CC virus by immunoassay of the antibody relates to epidemic NANBH virus in
CC which the peptide is used as an antigen. (Updated on 27-AUG-2003 to
CC correct OS field.)

XX
CC A DNA sequence (AAT27111) codes for SG3 antigen (AAR96093) comprising the
CC C-terminal 327 amino acids of hepatitis E virus (HEV) Burma strain capsid
CC protein (AAR96089). It is obtd. by PCR amplification of pBET1 contg. the
CC HEV ORF-2 (AAT27107) and ORF-3 (AAT27115). The amplified fragment is
CC inserted into pBluescript and the cloned insert is ligated into vector
CC pGEX for prodn. of SG3 in E. coli cells SG3 shows low antigenicity
CC compared with 62K antigen (see also AAR96091-92 and AAR96101-04) from HEV
CC Burma and Mexico strain capsid proteins, produced using a baculovirus
CC expression system. (Updated on 16-OCT-2003 to standardise OS field)

PT Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT immunoassay with hepatitis E virus peptide antigens.
XX
PS Disclosure; Col 29-32; 36pp; English.
XX
CC A method has been developed for detecting hepatitis E virus (HEV)
CC antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC HEV peptide antigen; and (b) examining the peptide for the presence of
CC bound Ab, where the presence of bound Ab indicates the presence of HEV
CC Ab. The present sequence encodes a specifically claimed HEV peptide
CC antigen. The method can be used to diagnose infection with the
CC enterically transmitted non-A/non-B viral hepatitis agent HEV,
CC specifically the HEV Burma and Mexico strains. (Updated on 25-MAR-2003 to
CC correct PF field.) (Updated on 17-OCT-2003 to standardise OS field)

XX
CC The invention provides a method for detecting a US (sub)type hepatitis E
CC virus (US-HEV), or its naturally occurring variants in a sample by
CC treatment with a binding partner specific for a marker of the virus, and
CC then detecting any complex formed. The method is used to diagnose
CC infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC are useful in vaccines or for passive immunisation. The polypeptides are
CC also used to raise specific antibodies (useful as immunoassay reagents).
CC Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC usual hybridisation and amplification assays for detecting infection. The
CC present sequence represents a HEV US subtype specific sequence obtained
CC by PCR amplification

XX
PS Disclosure; Page 75-76; 125pp; English.
XX
CC A DNA sequence (AAT27112) codes for SG3 antigen (AAR96094) comprising the
CC C-terminal 327 amino acids of hepatitis E virus (HEV) Mexico strain
CC capsid protein (AAR96090). It is obtd. by PCR amplification using a pBET1
CC clone plasmid contg. the HEV ORF-2 (AAT27108) and ORF-3 (AAT27116). The
CC amplified fragment is inserted into pBluescript and the cloned insert is
CC ligated into vector pGEX for prodn. of SG3 in E. coli cells. SG3 shows
CC low antigenicity when compared with 62K antigen (see also AAR96091-92 and
CC AAR96101-04) from HEV Burma and Mexico strain capsid proteins, produced
CC using a baculovirus expression system. (Updated on 16-OCT-2003 to
CC standardise OS field)

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 31-32; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present sequence encodes a specifically claimed HEV peptide
CC   antigen. The method can be used to diagnose infection with the
CC   enterically transmitted non-A/non-B viral hepatitis agent HEV,
CC   specifically the HEV Burma and Mexico strains. (Updated on 25-MAR-2003 to
CC   correct PF field.) (Updated on 17-OCT-2003 to standardise OS field)

XX
CC   The invention provides a method for detecting a US (sub)type hepatitis E
CC   virus (US-HEV), or its naturally occurring variants in a sample by
CC   treatment with a binding partner specific for a marker of the virus, and
CC   then detecting any complex formed. The method is used to diagnose
CC   infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC   open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC   are useful in vaccines or for passive immunisation. The polypeptides are
CC   also used to raise specific antibodies (useful as immunoassay reagents).
CC   Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC   usual hybridisation and amplification assays for detecting infection. The
CC   present sequence represents a DNA encoding a HEV US and CKS fusion
CC   protein

PT   New immunoreactive peptide pE2, cloned from the genome of a Chinese
PT   strain of hepatitis E virus (HEV), for detecting and diagnosing HEV
PT   infection and for use as a vaccine for prevention of the viral infection
PT   in humans.
XX
PS   Claim 5; Fig 2B-2D; 101pp; English.
XX
CC   The present sequence for hepatitis E virus (HEV) E2 cDNA fragment encodes
CC   for a novel peptide, pE2 which is cloned from ORF2 (AAS01448) of the HEV
CC   Chinese strain D11092 genome. During the cloning of the E2 fragment a
CC   single base deletion (presumed to be a PCR amplification error) at
CC   position 1811 of ORF2 resulted in a frame shift causing the premature
CC   termination at a new stop codon at position 1820-1822, and giving rise to
CC   a smaller peptide, pE2. Peptide pE2 is a highly immunoreactive viral
CC   peptide which can be used in the development of diagnostic methods for
CC   the detection of HEV. Peptide pE2 which has antigenic activity is also
CC   useful as a vaccine for immunising an individual against infection from
CC   HEV and for determining the presence of HEV antibodies in a biological
CC   test sample such as human blood serum or plasma for detection and
CC   diagnosis of HEV infection. An antibody against pE2 is useful for
CC   detecting an HEV particle, in a biological test sample. The use of
CC   recombinant peptides such as pE2 peptide have advantage over the prior
CC   art of using live intact virus particles by avoiding the potential risk
CC   of infectivity. The ORF3 (AAS01449) of HEV Chinese strain D11092 is used
CC   to clone a cDNA fragment E3 (AAS001450) which encodes pE3 peptide

CC The invention provides a method for detecting a US (sub)type hepatitis E
CC virus (US-HEV), or its naturally occurring variants in a sample by
CC treatment with a binding partner specific for a marker of the virus, and
CC then detecting any complex formed. The method is used to diagnose
CC infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC are useful in vaccines or for passive immunisation. The polypeptides are
CC also used to raise specific antibodies (useful as immunoassay reagents).
CC Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC usual hybridisation and amplification assays for detecting infection. The
CC present sequence represents a HEV US subtype specific sequence obtained
CC by PCR amplification

CC   The invention provides a method for detecting a US (sub)type hepatitis E
CC   virus (US-HEV), or its naturally occurring variants in a sample by
CC   treatment with a binding partner specific for a marker of the virus, and
CC   then detecting any complex formed. The method is used to diagnose
CC   infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC   open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC   are useful in vaccines or for passive immunisation. The polypeptides are
CC   also used to raise specific antibodies (useful as immunoassay reagents).
CC   Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC   usual hybridisation and amplification assays for detecting infection. The
CC   present sequence represents a HEV US subtype specific sequence obtained
CC   by PCR amplification

CC   The invention provides a method for detecting a US (sub)type hepatitis E
CC   virus (US-HEV), or its naturally occurring variants in a sample by
CC   treatment with a binding partner specific for a marker of the virus, and
CC   then detecting any complex formed. The method is used to diagnose
CC   infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC   open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC   are useful in vaccines or for passive immunisation. The polypeptides are
CC   also used to raise specific antibodies (useful as immunoassay reagents).
CC   Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC   usual hybridisation and amplification assays for detecting infection.
CC   Sequences AAZ00300-312 represent conserved nucleic acid sequences from
CC   various strains of HEV

XX
CC   The invention relate to a method for preparing recombinant polypeptides
CC   for use in set for assaying antibodies raised to hepatitis E virus. Set
CC   has a series of recombinant antigens synthesised in Escherichia coli
CC   cells transformed with recombinant DNAs. Recombinant DNAs involve
CC   fragment of the second and the third open reading frames of hepatitis E
CC   virus genome. Sets can contain E. coli beta-galactosidase as a control
CC   antigen. The antibodies are useful in medicine, molecular biology and
CC   genetic engineering of proteins. The present sequence is that of a
CC   hepatitis E virus peptide HE70 related polynucleotide, useful to the
CC   invention

XX
CC   The invention provides a method for detecting a US (sub)type hepatitis E
CC   virus (US-HEV), or its naturally occurring variants in a sample by
CC   treatment with a binding partner specific for a marker of the virus, and
CC   then detecting any complex formed. The method is used to diagnose
CC   infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC   open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC   are useful in vaccines or for passive immunisation. The polypeptides are
CC   also used to raise specific antibodies (useful as immunoassay reagents).
CC   Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC   usual hybridisation and amplification assays for detecting infection. The
CC   present sequence represents a HEV US subtype specific sequence obtained
CC   by PCR amplification

PT Hepatitis E virus (HEV) antigens derived from ORF 2 - useful as
PT diagnostic reagents for determining HEV infection and in vaccines.
XX
PS Disclosure; Page 72-73; 125pp; English.
XX
CC A DNA sequence (AAT27109) codes for 62K antigen (AAR96091) comprising the
CC C-terminal 549 amino acids of hepatitis E virus (HEV) Burma strain capsid
CC protein (AAR96089). It is obtd. by PCR amplification of HEV Burma ORF-2
CC (AAT27107) from pBET1 plasmid. The amplified fragment is inserted into
CC vector pGEX for prodn. 62K in E. coli cells. Expression of full-length
CC ORF-2 in Sf9 insect cells using a baculovirus system also results in
CC prodn. of 62K antigen (see also AAR96101 and AAR96103). 62K represents an
CC improved antigen, in comparison to bacterial expressed proteins, for use
CC in HEV diagnostic assays, and also has excellent immunogenic properties.
CC (Updated on 16-OCT-2003 to standardise OS field)

PT Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids
PT encoding it - useful for more accurate detection of HEV in samples, using
PT immuno-assays and nucleic acid hybridisation.
XX
PS Claim 1; Page 15-17; 29pp; Japanese.
XX
CC This sequence encodes a Hepatitis E viral hollow particle protein
CC described as ORF2. This polypeptide can be used to raise antibodies to
CC detect HEV infection in samples, e.g. by immuno-assay based techniques,
CC and the nucleic acid can be used for the same in nucleic acid
CC hybridisation assays. The polypeptide and nucleic acid allow more
CC accurate detection of HEV than previously possible

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 23-24; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present sequence encodes the protein from the open reading frame,
CC   ORF2, from HEV Burma strain. The method can be used to diagnose infection
CC   with the enterically transmitted non-A/non-B viral hepatitis agent HEV,
CC   specifically the HEV Burma and Mexico strains. (Updated on 25-MAR-2003 to
CC   correct PF field.) (Updated on 17-OCT-2003 to standardise OS field)

PT Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids
PT encoding it - useful for more accurate detection of HEV in samples, using
PT immuno-assays and nucleic acid hybridisation.
XX
PS Claim 13; Page 24-26; 29pp; Japanese.
XX
CC This sequence encodes a Hepatitis E viral hollow particle protein. This
CC polypeptide can be used to raise antibodies to detect HEV infection in
CC samples, e.g. by immuno-assay based techniques, and the nucleic acid can
CC be used for the same in nucleic acid hybridisation assays. The
CC polypeptides and nucleic acids allow more accurate detection of HEV than
CC previously possible

PT   Antigens of hepatitis E virus (HEV) - selectively immuno:reactive to
PT   convalescent and/or acute phase circulating antibodies to HEV.
XX
PS   Disclosure; Page 39-41; 78pp; English.
XX
CC   RNA from an HEV strain isolated in the Xinjiang region of China was
CC   subjected to RT-PCR to obtain fragments corresp. to ORF2 (given in
CC   AAQ86592) and ORF3 (AAQ86593) that encoded antigenic proteins (AAR70323-
CC   24, respectively). DNA fragments were manipulated into pGEX vectors for
CC   production of GST fusion proteins in E. coli. Applications include HEV
CC   infection diagnosis, therapy and vaccine development. (Updated on 25-MAR-
CC   2003 to correct PN field.)

PT   Polypeptide fragments of hepatitis E virus (HEV) for vaccine compositions
PT   and diagnosis in preventing and treating HEV infection.
XX
PS   Example 1; Page 82-83; 91pp; Chinese.
XX
CC   The sequence encodes hepatitis E virus (HEV) ORF-2 polypeptide. The
CC   invention relates to novel n-mer polypeptides comprising amino acids of
CC   ORF-2 of HEV where n = 2-180. The polypeptides of the invention have
CC   virucide activity. The polypeptide of HEV, its fragments, and chimeric
CC   proteins, are useful for vaccine compositions and diagnosis in preventing
CC   and treating HEV infection by immunisation, which may also be applied in
CC   the diagnosis of HEV infection

PT Hepatitis E virus monoclonal antibodies and their active fragments, for
PT use in diagnosis and developing remedies e.g. vaccines for preventing or
PT treating hepatitis E virus infection.
XX
PS Example 1; Page 131-133; 165pp; Chinese.
XX
CC The invention relates to a monoclonal antibody that binds specifically to
CC hepatitis E virus open-reading frame (ORF) 2. Also disclosed are
CC nucleotide sequences encoding the heavy-chain and/or light-chain variable
CC region of their degeneration sequences. The monoclonal antibody is
CC selected from anti-HEV monoclonal antibody 8C11 secreted by hybridoma
CC CCTCC-C200116, anti-HEV monoclonal antibody 13D8 secreted by hybridoma

```
CC   CCTCC-C200114, anti-HEV monoclonal antibody 8H3 secreted by hybridoma
CC   CCTCC-C200117, and anti-HEV monoclonal antibody 16D7 secreted by
CC   hybridoma CCTCC-C200114. The monoclonal antibodies and their active
CC   fragments are useful in diagnosis and developing remedies e.g. vaccines
CC   for preventing or treating hepatitis E virus infection. From the whole
CC   HEV gene obtained in patients, the HEV ORF fragment was prepared by using
CC   the method of Aye et al. The polypeptide NE2 was then expressed and
CC   isolated after biotechnological manipulations, which was characterised.
CC   Its analogs were also produced for immunising mice and construction of
CC   hybridomas. Tests were carried out to confirm usefulness of such
CC   polypeptides and monoclonal antibodies. The current sequence represents
CC   the HEV ORF2 encoding DNA.

XX
PS Disclosure; Page 69-70; 125pp; English.
XX
CC The hepatitis E virus (HEV) Burma strain ORF-2 (AAT27107) codes for the
CC putative capsid protein (AAR96089). PCR amplification of ORF-2 allows
CC prodn. of capsid protein or of C-terminal regions of the capsid protein
CC (see also AAR96091, AAR96093 and AAR96095) and expression in Spodoptera
CC frugiperda Sf9 insect cells using a baculovirus vector provides
CC recombinant C-terminal regions (see also AAR96101 and AAR96103) useful as
CC diagnostic reagents and in vaccines. The HEV Mexico strain ORF-2
CC (AAT27108) may similarly be used. (Updated on 16-OCT-2003 to standardise
CC OS field)

PT New immunoreactive peptide pE2, cloned from the genome of a Chinese
PT strain of hepatitis E virus (HEV), for detecting and diagnosing HEV
PT infection and for use as a vaccine for prevention of the viral infection
PT in humans.
XX
PS Disclosure; Fig 2A-2D; 101pp; English.
XX
CC The present sequence for hepatitis E virus (HEV) ORF2 cDNA is used to
CC clone a cDNA fragment E2 (AAS01434) which encodes for a novel peptide,
CC pE2. During the cloning of the E2 fragment a single base deletion
CC (presumed to be a PCR amplification error) at position 1811 of ORF2
CC resulted in a frame shift causing the premature termination at a new stop

```
CC   codon at position 1820-1822, and giving rise to a smaller peptide, pE2.
CC   Peptide pE2 is a highly immunoreactive viral peptide which can be used in
CC   the development of diagnostic methods for the detection of HEV. Peptide
CC   pE2 which has antigenic activity is also useful as a vaccine for
CC   immunising an individual against infection from HEV and for determining
CC   the presence of HEV antibodies in a biological test sample such as human
CC   blood serum or plasma for detection and diagnosis of HEV infection. An
CC   antibody against pE2 is useful for detecting an HEV particle, in a
CC   biological test sample. The use of recombinant peptides such as pE2
CC   peptide have advantage over the prior art of using live intact virus
CC   particles by avoiding the potential risk of infectivity. The ORF3
CC   (AAS01449) of HEV Chinese strain D11092 is used to clone a cDNA fragment
CC   E3 (AAS001450) which encodes pE3 peptide. (Updated on 11-SEP-2003 to
CC   standardise OS field)

XX
CC A DNA sequence (AAT27110) codes for 62K antigen (AAR96092) comprising the
CC C-terminal 549 amino acids of hepatitis E virus (HEV) Mexico strain
CC capsid protein (AAR96090). It is obtd. by PCR amplification of HEV Mexico
CC ORF-2 (AAT27108). The amplified fragment is inserted into vector pGEX for
CC prodn. 62K in E. coli cells. Expression of full-length ORF-2 in Sf9
CC insect cells using a baculovirus system also results in prodn. of 62K
CC antigen (see also AAR96101 and AAR96103). 62K represents an improved
CC antigen, in comparison to bacterial expressed proteins, for use in HEV
CC diagnostic assays, and also has excellent immunogenic properties.
CC (Updated on 16-OCT-2003 to standardise OS field)

PT Polypeptide fragments of hepatitis E virus (HEV) for vaccine compositions
PT and diagnosis in preventing and treating HEV infection.
XX
PS Example 1; Page 83-84; 91pp; Chinese.
XX
CC The sequence encodes hepatitis E virus (HEV) ORF-2 polypeptide. The
CC invention relates to novel n-mer polypeptides comprising amino acids of
CC ORF-2 of HEV where n = 2-180. The polypeptides of the invention have
CC virucide activity. The polypeptide of HEV, its fragments, and chimeric
CC proteins, are useful for vaccine compositions and diagnosis in preventing
CC and treating HEV infection by immunisation, which may also be applied in
CC the diagnosis of HEV infection

PT Hepatitis E virus monoclonal antibodies and their active fragments, for
PT use in diagnosis and developing remedies e.g. vaccines for preventing or
PT treating hepatitis E virus infection.
XX
PS Example 1; Page 133-135; 165pp; Chinese.
XX
CC The invention relates to a monoclonal antibody that binds specifically to
CC hepatitis E virus open-reading frame (ORF) 2. Also disclosed are
CC nucleotide sequences encoding the heavy-chain and/or light-chain variable
CC region of their degeneration sequences. The monoclonal antibody is
CC selected from anti-HEV monoclonal antibody 8C11 secreted by hybridoma
CC CCTCC-C200116, anti-HEV monoclonal antibody 13D8 secreted by hybridoma
CC CCTCC-C200114, anti-HEV monoclonal antibody 8H3 secreted by hybridoma
CC CCTCC-C200117, and anti-HEV monoclonal antibody 16D7 secreted by
CC hybridoma CCTCC-C200114. The monoclonal antibodies and their active
CC fragments are useful in diagnosis and developing remedies e.g. vaccines
CC for preventing or treating hepatitis E virus infection. From the whole
CC HEV gene obtained in patients, the HEV ORF fragment was prepared by using
CC the method of Aye et al. The polypeptide NE2 was then expressed and
CC isolated after biotechnological manipulations, which was characterised.
CC Its analogs were also produced for immunising mice and construction of
CC hybridomas. Tests were carried out to confirm usefulness of such
CC polypeptides and monoclonal antibodies. The current sequence represents a
CC HEV related DNA.

XX
PS   Disclosure; Fig 1B; 70pp; English.
XX
CC   This DNA encodes a swine hepatitis E virus (HEV) open reading frame (ORF)
CC   2 protein. The protein can be expressed by standard recombinant
CC   methodology. The ORF2 protein is useful for detecting antibodies to HEV
CC   in a biological sample and for producing antibodies. The antibodies are
CC   useful for detecting HEV in a biological sample, which is useful in
CC   diagnosis of infection and disease caused by swine HEV, and for
CC   monitoring the progression of such disease. The method is also useful for
CC   monitoring the efficacy of therapeutic agents during the course of
CC   treatment of HEV infection and disease in a mammal. The ORF2 protein can
CC   be useful as diagnostic agent and as vaccine. The antibodies are useful
CC   as anti-viral agent, and as a means for enhancing the immune response.
CC   The ORF2 protein is sufficiently closely related to human HEV, and allows
CC   evaluation as a potential source of infection in humans

XX
CC The hepatitis E virus (HEV) Mexico strain ORF-2 (AAT27108) codes for the
CC putative capsid protein (AAR96090). PCR amplification of ORF-2 allows

```
CC   prodn. of capsid protein or of C-terminal regions of the capsid protein
CC   (see also AAR96092, AAR96094 and AAR96096) and expression in Spodoptera
CC   frugiperda Sf9 insect cells using a baculovirus vector provides
CC   recombinant C-terminal regions (see also AAR96102 and AAR96104) useful as
CC   diagnostic reagents and in vaccines. The HEV Burma strain ORF-2
CC   (AAT27107) may similarly be used. (Updated on 16-OCT-2003 to standardise
CC   OS field)

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 25-28; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present sequence encodes the protein from the open reading frame,
CC   ORF2, from HEV Mexico strain. The method can be used to diagnose
CC   infection with the enterically transmitted non-A/non-B viral hepatitis
CC   agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-
CC   MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS
CC   field)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX
CC A DNA sequence (AAT27109) codes for 62K antigen (AAR96091) comprising the
CC C-terminal 549 amino acids of hepatitis E virus (HEV) Burma strain capsid
CC protein (AAR96089). It is obtd. by PCR amplification of HEV Burma ORF-2
CC (AAT27107) from pBET1 plasmid. The amplified fragment is inserted into
CC vector pGEX for prodn. 62K in E. coli cells. Expression of full-length
CC ORF-2 in Sf9 insect cells using a baculovirus system also results in
CC prodn. of 62K antigen (see also AAR96101 and AAR96103). 62K represents an
CC improved antigen, in comparison to bacterial expressed proteins, for use
CC in HEV diagnostic assays, and also has excellent immunogenic properties.
CC (Updated on 16-OCT-2003 to standardise OS field)

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 23-24; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present seq[illegible]e encodes the protein from the open reading frame,
CC   ORF2, from HEV[illegible]rain. The method can be used to diagnose infection
CC   with the[illegible]nsmitted non-A/non-B viral hepatitis agent HEV,
CC   spe[illegible]a and Mexico strains. (Updated on 25-MAR-2003 to
CC   [illegible]ed on 17-OCT-2003 to standardise OS field)

PT Hepatitis E virus (HEV) antigens derived from ORF 2 - useful as
PT diagnostic reagents for determining HEV infection and in vaccines.
XX
PS Disclosure; Page 69-70; 125pp; English.

XX
CC The hepatitis E virus (HEV) Burma strain ORF-2 (AAT27107) codes for the
CC putative capsid protein (AAR96089). PCR amplification of ORF-2 allows
CC prodn. of capsid protein or of C-terminal regions of the capsid protein
CC (see also AAR96091, AAR96093 and AAR96095) and expression in Spodoptera
CC frugiperda Sf9 insect cells using a baculovirus vector provides
CC recombinant C-terminal regions (see also AAR96101 and AAR96103) useful as
CC diagnostic reagents and in vaccines. The HEV Mexico strain ORF-2
CC (AAT27108) may similarly be used. (Updated on 16-OCT-2003 to standardise
CC OS field)

PT   New immunogenic hepatitis E virus (HEV) peptide(s) - are from the ORF1,
PT   ORF2 and ORF3 regions of HEV, useful as a vaccine against HEV infection.
XX
PS   Disclosure; Fig 7; 48pp; English.
XX
CC   Immunogenic hepatitis E virus (HEV) peptides are selected from the ORF1,
CC   ORF2 and ORF3 regions of HEV. The peptides can be used in vaccines to
CC   prevent infection by HEV. The antibodies can neutralise and block HEV
CC   infection and can be used to prevent or treat HEV infection. The peptides
CC   and antibodies can also be used as diagnostic reagents. (Updated on 25-
CC   MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS
CC   field)

XX
PT   Antigen and antibody vaccines against hepatitis E virus infection -
PT   contain peptide(s) derived from capsid protein C-terminal or antibodies
PT   against protein.
XX
PS   Disclosure; Fig 7; 43pp; English.
XX
CC   The sequence is that encoding Burma strain hepatitis E virus (HEV) open
CC   reading frames ORF2 and ORF3. ORF2 encodes the putative capsid protein of
CC   the virus, this protein or peptide fragments of it may be used in a
CC   vaccine composition for immunising an individual against HEV. Antibodies
CC   raised against these peptides can also be used in such vaccines. (Updated
CC   on 25-MAR-2003 to correct PN field.)

PT   Hepatitis E virus proteins - useful for diagnosis or vaccine production
PT   the virus.
XX
PS   Claim 1; Col 51-58; 47pp; English.
XX
CC   The present sequence represents the genome of the Burma strain of
CC   enterically transmitted non A non B hepatitis virus (ET-NANB) (hepatitis
CC   E virus (HEV)). The specification describes an isolated protein which is
CC   specifically immunoreactive with antibodies present in individuals
CC   infected with HEV and encoded by a sequence contained in an open reading
CC   frame (ORF) of an HEV genome. The genome has a sequence that is more than
CC   70% identical to the ORF1 sequence from Burma HEV isolate. The protein is
CC   used as a vaccine and a diagnostic probe for ET-NANB. (Updated on 25-MAR-
CC   2003 to correct PR field.) (Updated on 27-AUG-2003 to correct OS field.)

CC   The present sequence represents the sequence of the Burmese isolate of an
CC   enterically transmitted nonA/nonB viral hepatitis agent (ET-NANB). The
CC   nucleic acid sequence may be used for identifying and sequencing the
CC   entire viral agent (also referred to as HEV), detecting ET-NANB in
CC   infected samples, e.g. by specific amplification of virus-derived DNA
CC   sequences and for producing recombinant viral proteins for use in
CC   vaccines. (Updated on 25-MAR-2003 to correct PF field.)

PT   Identifying recombinant antigen immunoreactive with antibody induced by
PT   hepatitis E virus (HEV), for detecting HEV infection, comprises
PT   immunoreacting a polypeptide from an HEV genome with an HEV-positive
PT   antiserum.
XX
PS   Claim 5; Col 49-56; 46pp; English.
XX
CC   The present invention describes a method for identifying a recombinant
CC   antigen immunoreactive with a hepatitis E virus (HEV)-induced antibody.
CC   The method comprises producing a polypeptide derived from an HEV genome,
CC   immunoreacting the polypeptide with an HEV-positive antiserum and
CC   selecting the polypeptide as a recombinant antigen if the polypeptide
CC   reacts with the HEV-positive antiserum. The method is useful for
CC   identifying recombinant antigen immunoreactive with antibody induced by
CC   HEV. The enterically transmitted non-A/non-B hepatitis (ET-NANB (also
CC   known as HEV))-specific fragments are useful for identifying ET-NANB-
CC   derived cDNAs, which contain additional sequence information, as primers
CC   for detecting ET-NANB viral genomic material in a patient sample, for the
CC   synthesis of polypeptides for use in immunoassays, and for identifying
CC   similar antigenic regions encoded by related viral strains, e.g. Burmese
CC   strain. The antigens are especially useful in the preparation of vaccine
CC   against ET-NANB infection. These antigens may further be used to prepare
CC   antibodies to ET-NANB virus particles for use directly as antiviral
CC   agents, and to produce antiserum designed for pre- or post-exposure
CC   prophylaxis. The present sequence represents a specifically claimed HEV
CC   Burma strain gene sequence for use in the present invention

XX
CC The invention relates to an isolated DNA comprising the genome of an
CC enterically transmitted nonA/nonB (ET-NANB) viral hepatitis agent (also
CC referred as HEV). The DNA sequences or their fragments are useful in
CC preparing ET-NANB viral proteins and as probes for virus detection. These
CC are particularly useful in diagnosing infection by an enterically
CC transmitted agent (e.g. ET-NANB virus), as well as in vaccine production.
CC The present sequence represents a ET-NANB viral DNA sequence from HEV-
CC Burma strain

XX
CC   The invention comprises a method for detecting the presence of
CC   enterically transmitted nonA/nonB hepatitis viral (HEV) agents in a
CC   sample and isolating HEV agents or nucleic acid fragments produced by the
CC   agent. The method utilises PCR - using bile from a human or cynomolgus
CC   monkey actively infected with HEV as a source of the agent. The method of
CC   the invention is used for detecting the presence of a viral agent in a
CC   sample of cultured cells infected with the agent and isolating
CC   enterically transmitted nonA/nonB HEV agents or nucleic acid fragments
CC   produced by the agent. The present DNA sequence was isolated from a
CC   Burmese strain of the Hepatitis E virus, the present DNA sequence has
CC   three open reading frames ORF1, ORF2 and ORF3

PT   Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids
PT   encoding it - useful for more accurate detection of HEV in samples, using
PT   immuno-assays and nucleic acid hybridisation.
XX
PS   Claim 1; Page 15-17; 29pp; Japanese.
XX
CC   This sequence encodes a Hepatitis E viral hollow particle protein
CC   described as ORF2. This polypeptide can be used to raise antibodies to
CC   detect HEV infection in samples, e.g. by immuno-assay based techniques,
CC   and the nucleic acid can be used for the same in nucleic acid
CC   hybridisation assays. The polypeptide and nucleic acid allow more
CC   accurate detection of HEV than previously possible

PT Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids
PT encoding it - useful for more accurate detection of HEV in samples, using
PT immuno-assays and nucleic acid hybridisation.
XX
PS Claim 13; Page 24-26; 29pp; Japanese.
XX
CC This sequence encodes a Hepatitis E viral hollow particle protein. This
CC polypeptide can be used to raise antibodies to detect HEV infection in
CC samples, e.g. by immuno-assay based techniques, and the nucleic acid can
CC be used for the same in nucleic acid hybridisation assays. The
CC polypeptides and nucleic acids allow more accurate detection of HEV than
CC previously possible

PT Antigens of hepatitis E virus (HEV) - selectively immuno:reactive to
PT convalescent and/or acute phase circulating antibodies to HEV.
XX
PS Disclosure; Page 39-41; 78pp; English.
XX
CC RNA from an HEV strain isolated in the Xinjiang region of China was
CC subjected to RT-PCR to obtain fragments corresp. to ORF2 (given in
CC AAQ86592) and ORF3 (AAQ86593) that encoded antigenic proteins (AAR70323-
CC 24, respectively). DNA fragments were manipulated into pGEX vectors for
CC production of GST fusion proteins in E. coli. Applications include HEV
CC infection diagnosis, therapy and vaccine development. (Updated on 25-MAR-
CC 2003 to correct PN field.)

PT   Polypeptide fragments of hepatitis E virus (HEV) for vaccine compositions
PT   and diagnosis in preventing and treating HEV infection.
XX
PS   Example 1; Page 82-83; 91pp; Chinese.
XX
CC   The sequence encodes hepatitis E virus (HEV) ORF-2 polypeptide. The
CC   invention relates to novel n-mer polypeptides comprising amino acids of
CC   ORF-2 of HEV where n = 2-180. The polypeptides of the invention have
CC   virucide activity. The polypeptide of HEV, its fragments, and chimeric
CC   proteins, are useful for vaccine compositions and diagnosis in preventing
CC   and treating HEV infection by immunisation, which may also be applied in
CC   the diagnosis of HEV infection

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Funding for EST sequencing was provided by funds dedicated to J.P.RENARD (BDR, Inra). Funding for construction and subtraction of the cDNA library was provided by USDA ARS contract No 58-1275-2-020 to H. A. Lewin The cDNA library was constructed, normalized and subtracted by Dr. A. Hernandez (W.M. Keck Center, University of Illinois Urbana-Champaign) and S. Degrelle (BDR, Inra) as described in Bonaldo et al.(1996), Genome Research 6, 791-806. BE03 library is a normalized library of embryonic tissues subtracted with 7800 known EST sequences. The double-stranded cDNA was size selected (>450 bp), adaptored with EcoRI adaptors at both ends and digested with NotI. The cDNA was then directionally cloned into EcoRI-NotI digested pGEM11Zf(+) phagemid vector. Insert size was between 450-2200 bp. Sequence cleaned of vector, adaptator and repetitions. Contact us at sigenasupport@jouy.inra.fr to obtain the chromatogram of this sequence.

/note="Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_1: EcoR I; Site_2: Not I; tissues: Cholonic mucosa with Crohns disease, Cholonic mucosa with ulcerative colitis, Fetal thymus, Cervix, Cervical adenosquamous carcinoma, Ligament cells, Prostate carcinoma, Bladder carcinoma, Brain oligodenroga ; NCI_CGAP_Sub9 is a subtracted cDNA library constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tags for this library are CGTC, AACG, GGGCC, GGAAG, TAGC, TAAGC, ATGG, AGACA, ATCAC. For additional information, contact: Bento Soares, bento-soares@uiowa.edu

BC068239/c

LOCUS	BC068239 2453 bp mRNA linear HTC 02-APR-2004
DEFINITION	Mus musculus cDNA clone IMAGE:5324518.
ACCESSION	BC068239
VERSION	BC068239.1 GI:46189234
KEYWORDS	HTC.
SOURCE	Mus musculus (house mouse)
ORGANISM	Mus musculus Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus.
REFERENCE	1 (bases 1 to 2453)
AUTHORS	Strausberg,R.L., Feingold,E.A., Grouse,L.H., Derge,J.G., Klausner,R.D., Collins,F.S., Wagner,L., Shenmen,C.M., Schuler,G.D., Altschul,S.F., Zeeberg,B., Buetow,K.H., Schaefer,C.F., Bhat,N.K., Hopkins,R.F., Jordan,H., Moore,T., Max,S.I., Wang,J., Hsieh,F., Diatchenko,L., Marusina,K., Farmer,A.A., Rubin,G.M., Hong,L., Stapleton,M., Soares,M.B., Bonaldo,M.F., Casavant,T.L., Scheetz,T.E., Brownstein,M.J., Usdin,T.B., Toshiyuki,S., Carninci,P., Prange,C., Raha,S.S., Loquellano,N.A., Peters,G.J., Abramson,R.D., Mullahy,S.J., Bosak,S.A., McEwan,P.J., McKernan,K.J., Malek,J.A., Gunaratne,P.H., Richards,S., Worley,K.C., Hale,S., Garcia,A.M., Gay,L.J., Hulyk,S.W., Villalon,D.K., Muzny,D.M., Sodergren,E.J., Lu,X., Gibbs,R.A., Fahey,J., Helton,E., Ketteman,M., Madan,A., Rodrigues,S., Sanchez,A., Whiting,M., Madan,A., Young,A.C., Shevchenko,Y., Bouffard,G.G., Blakesley,R.W., Touchman,J.W., Green,E.D., Dickson,M.C., Rodriguez,A.C., Grimwood,J., Schmutz,J., Myers,R.M., Butterfield,Y.S., Krzywinski,M.I., Skalska,U., Smailus,D.E., Schnerch,A., Schein,J.E., Jones,S.J. and Marra,M.A.
TITLE	Generation and initial analysis of more than 15,000 full-length human and mouse cDNA sequences
JOURNAL	Proc. Natl. Acad. Sci. U.S.A. 99 (26), 16899-16903 (2002)
REFERENCE	2 (bases 1 to 2453)
AUTHORS	Strausberg,R.
TITLE	Direct Submission
JOURNAL	Submitted (31-MAR-2004) National Institutes of Health, Mammalian Gene Collection (MGC), Cancer Genomics Office, National Cancer Institute, 31 Center Drive, Room 11A03, Bethesda, MD 20892-2590, USA

PT Hepatitis E virus (HEV) antigens derived from ORF 2 - useful as
PT diagnostic reagents for determining HEV infection and in vaccines.
XX
PS Claim 7; Page 95-97; 125pp; English.
XX
CC DNA (AAT27109) coding for the 62K antigen (AAR96091) of hepatitis E virus
CC (HEV) Burma strain capsid protein was cloned into baculovirus expression
CC vector pBluBacIII and recombinant 62K was expressed in Sf9 insect cells.
CC High levels of expression were obtd. and the recombinant 62K was obtd. in
CC over 95% purity. However, C-terminal processing resulted in the deletion
CC of 9 or 23 amino acids from 62K, giving 2 related polypeptide species
CC (AAR96101 and AAR96103). Similar results were obtd. with HEV Mexico 62K
CC antigen (see also AAR96102 and AAR96104). Recombinant 62K represents an
CC improved antigen, in comparison to bacterial expressed proteins, for use
CC in HEV diagnostic assays, and also has excellent immunogenic properties.
CC (Updated on 16-OCT-2003 to standardise OS field)

XX
CC   62K antigen (AAR96091) comprises the C-terminal 549 amino acids of
CC   hepatitis E virus (HEV) Burma strain capsid protein (see also AAR96089).
CC   It is obtd. by PCR amplification of HEV Burma ORF-2 (AAT27107), insertion
CC   of amplified DNA (AAT27109) into vector pGEX and expression in E. coli
CC   cells. Expression of full-length ORF-2 in Sf9 insect cells using a
CC   baculovirus system also results in prodn. of 62K antigen (see also
CC   AAR96101 and AAR96103). 62K represents an improved antigen, in comparison
CC   to bacterial expressed proteins, for use in HEV diagnostic assays, and
CC   also has excellent immunogenic properties. (Updated on 16-OCT-2003 to
CC   standardise OS field)

PT   New immunogenic hepatitis E virus (HEV) peptide(s) - are from the ORF1,
PT   ORF2 and ORF3 regions of HEV, useful as a vaccine against HEV infection.
XX
PS   Disclosure; Fig 8; 48pp; English.
XX
CC   Immunogenic hepatitis E virus (HEV) peptides are selected from the ORF1,
CC   ORF2 and ORF3 regions of HEV. The peptides can be used in vaccines to
CC   prevent infection by HEV. The antibodies can neutralise and block HEV
CC   infection and can be used to prevent or treat HEV infection. The peptides
CC   and antibodies can also be used as diagnostic reagents. (Updated on 25-
CC   MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS
CC   field)

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 39-42; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present sequence represents the protein from the open reading
CC   frame, ORF2, from HEV Burma strain. The method can be used to diagnose
CC   infection with the enterically transmitted non-A/non-B viral hepatitis
CC   agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-
CC   MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS
CC   field)

PT the virus.
XX
PS Claim 6; Col 65-70; 47pp; English.
XX
CC AAW80196-98 are encoded by the genome of the Burma strain of enterically
CC transmitted non A non B hepatitis virus (ET-NANB) (hepatitis E virus
CC (HEV)). The specification describes an isolated protein which is
CC specifically immunoreactive with antibodies present in individuals
CC infected with HEV and encoded by a sequence contained in an open reading
CC frame (ORF) of an HEV genome. The genome has a sequence that is more than
CC 70% identical to the ORF1 sequence from Burma HEV isolate. The protein is
CC used as a vaccine and a diagnostic probe for ET-NANB. (Updated on 25-MAR-
CC 2003 to correct PR field.) (Updated on 27-AUG-2003 to correct OS field.)

PT New isolated swine hepatitis E virus - used to develop products for the

```
PT   diagnosis, prevention and treatment of hepatitis E virus infection in
PT   mammals, particularly humans.
XX
PS   Example 1; Fig 3A; 70pp; English.
XX
CC   This invention describes a swine hepatitis E virus (HEV) and its natural
CC   mutants which are capable of cross-reacting with antibodies reactive with
CC   a human HEV strain or natural mutants. The HEV and the proteins can be
CC   used in vaccines for immunising against HEV infection. The swine HEV can
CC   be used in humans to prevent possible infection by human HEV. The swine
CC   HEV can also be used as a therapeutic treatment for infection by other
CC   strains of HEV. The swine HEV can also be used for the production of
CC   antibodies which can be used in therapy, detection and diagnosis. The
CC   products can also be used for determining the susceptibility of cells or
CC   organs to infection with swine HEV. The swine HEV is particularly useful
CC   for the development of agents for the prevention, treatment and detection
CC   of human HEV because it is not a human virus and thus can be handled both
CC   experimentally and clinically without fear of severe infection and/or
CC   contamination

PT   Identifying recombinant antigen immunoreactive with antibody induced by
PT   hepatitis E virus (HEV), for detecting HEV infection, comprises
PT   immunoreacting a polypeptide from an HEV genome with an HEV-positive
PT   antiserum.
XX
PS   Claim 6; Col 63-68; 46pp; English.
XX
CC   The present invention describes a method for identifying a recombinant
CC   antigen immunoreactive with a hepatitis E virus (HEV)-induced antibody.
CC   The method comprises producing a polypeptide derived from an HEV genome,
CC   immunoreacting the polypeptide with an HEV-positive antiserum and
CC   selecting the polypeptide as a recombinant antigen if the polypeptide
CC   reacts with the HEV-positive antiserum. The method is useful for
CC   identifying recombinant antigen immunoreactive with antibody induced by
CC   HEV. The enterically transmitted non-A/non-B hepatitis (ET-NANB (also
CC   known as HEV))-specific fragments are useful for identifying ET-NANB-
CC   derived cDNAs, which contain additional sequence information, as primers
CC   for detecting ET-NANB viral genomic material in a patient sample, for the
CC   synthesis of polypeptides for use in immunoassays, and for identifying
CC   similar antigenic regions encoded by related viral strains, e.g. Burmese
CC   strain. The antigens are especially useful in the preparation of vaccine
CC   against ET-NANB infection. These antigens may further be used to prepare
CC   antibodies to ET-NANB virus particles for use directly as antiviral
CC   agents, and to produce antiserum designed for pre- or post-exposure
CC   prophylaxis. The present sequence represents a specifically claimed HEV
CC   Burma strain protein sequence for use in the present invention

XX
CC The invention relates to an isolated DNA comprising the genome of an
CC enterically transmitted nonA/nonB (ET-NANB) viral hepatitis agent (also
CC referred as HEV). The DNA sequences or their fragments are useful in
CC preparing ET-NANB viral proteins and as probes for virus detection. These
CC are particularly useful in diagnosing infection by an enterically
CC transmitted agent (e.g. ET-NANB virus), as well as in vaccine production.
CC The present sequence represents a ORF2 protein encoded by a ET-NANB viral
CC DNA sequence from HEV-Burma strain

PT Detecting the presence of enterically transmitted nonA/nonB hepatitis
PT viral (HEV) agents in bile samples from infected humans and monkeys using
PT polymerase chain reaction.
XX
PS Disclosure; Col 19-24; 61pp; English.
XX
CC The invention comprises a method for detecting the presence of
CC enterically transmitted nonA/nonB hepatitis viral (HEV) agents in a
CC sample and isolating HEV agents or nucleic acid fragments produced by the
CC agent. The method utilises PCR - using bile from a human or cynomolgus
CC monkey actively infected with HEV as a source of the agent. The method of
CC the invention is used for detecting the presence of a viral agent in a
CC sample of cultured cells infected with the agent and isolating
CC enterically transmitted nonA/nonB HEV agents or nucleic acid fragments
CC produced by the agent. The present amino acid sequence represents the
CC protein encoded by open reading frame 2 (ORF2) of a DNA sequence isolated
CC from a Burmese strain of the Hepatitis E virus

PT New proteins derived from an enterically transmitted non-A/non-B (ET-
PT NANB) viral hepatitis agent, useful for diagnosing ET-NANB infection and
PT producing vaccines for immunizing an individual against ET-NANB hepatitis
PT viral agent.
XX
PS Disclosure; SEQ ID NO 8; 81pp; English.
XX
CC The invention relates to a protein derived from an enterically
CC transmitted non-A/non-B viral hepatitis agent. The viral proteins are
CC useful for detecting infection by the enterically transmitted non-A/non-B
CC (ET-NANB/HEV) hepatitis viral agent. The proteins are also useful for
CC producing vaccines for immunising an individual against HEV hepatitis
CC viral agent. The DNA fragments are useful for identifying and sequencing
CC the entire viral agent and for assaying the viral agent in an infected
CC sample. The present sequence is used in the exemplification of the
CC invention.

XX
PS Claim 1; Page 15-17; 29pp; Japanese.
XX
CC This sequence represents a Hepatitis E viral hollow particle protein
CC described as ORF2. This polypeptide can be used to raise antibodies to
CC detect HEV infection in samples, e.g. by immuno-assay based techniques,
CC and the nucleic acid can be used for the same in nucleic acid
CC hybridisation assays. The polypeptide and nucleic acid allow more
CC accurate detection of HEV than previously possible

PT Hepatitis E virus (HEV) antigens derived from ORF 2 - useful as
PT diagnostic reagents for determining HEV infection and in vaccines.
XX
PS Claim 8; Page 97-98; 125pp; English.
XX
CC DNA (AAT27110) coding for the 62K antigen (AAR96092) of hepatitis E virus
CC (HEV) Mexico strain capsid protein was cloned into baculovirus expression
CC vector pBluBacIII and recombinant 62K was expressed in Sf9 insect cells.
CC High levels of expression were obtd. and the recombinant 62K was obtd. in
CC over 95% purity. However, C-terminal processing resulted in the deletion
CC of 9 or 23 amino acids from 62K, giving 2 related polypeptide species
CC (AAR96102 and AAR96104). Similar results were obtd. with HEV Burma 62K
CC antigen (see also AAR96101 and AAR96103). Recombinant 62K represents an
CC improved antigen, in comparison to bacterial expressed proteins, for use
CC in HEV diagnostic assays, and also has excellent immunogenic properties.
CC (Updated on 16-OCT-2003 to standardise OS field)

XX
CC   62K antigen (AAR96092) comprises the C-terminal 549 amino acids of
CC   hepatitis E virus (HEV) Mexico strain capsid protein (see also AAR96090).
CC   It is obtd. by PCR amplification of HEV Mexico ORF-2 (AAT27108),
CC   insertion of amplified DNA (AAT27110) into vector pGEX and expression in
CC   E. coli cells. Expression of full-length ORF-2 in Sf9 insect cells using
CC   a baculovirus system also results in prodn. of 62K antigen (see also
CC   AAR96102 and AAR96104). 62K represents an improved antigen, in comparison
CC   to bacterial expressed proteins, for use in HEV diagnostic assays, and
CC   also has excellent immunogenic properties. (Updated on 16-OCT-2003 to
CC   standardise OS field)

XX
CC   The putative capsid protein (AAR96090) of hepatitis E virus (HEV) Mexico
CC   strain is encoded by ORF-2 (AAT27108) of the virus. PCR amplification of
CC   ORF-2 allows prodn. of capsid protein or of C-terminal regions of the
CC   capsid protein (see also AAR96092, AAR96094 and AAR96096) and expression
CC   in Spodoptera frugiperda Sf9 insect cells using a baculovirus vector
CC   provides recombinant C-terminal regions (see also AAR96102 and AAR96104)
CC   useful as diagnostic reagents and in vaccines. The HEV Burma strain
CC   capsid protein (AAR96089) may similarly be used. (Updated on 16-OCT-2003
CC   to standardise OS field)

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 43-46; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present sequence represents the protein from the open reading
CC   frame, ORF2, from HEV Mexico strain. The method can be used to diagnose
CC   infection with the enterically transmitted non-A/non-B viral hepatitis
CC   agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-
CC   MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS
CC   field)

PT   New isolated swine hepatitis E virus - used to develop products for the
PT   diagnosis, prevention and treatment of hepatitis E virus infection in
PT   mammals, particularly humans.
XX
PS   Example 1; Fig 3A; 70pp; English.
XX
CC   This invention describes a swine hepatitis E virus (HEV) and its natural
CC   mutants which are capable of cross-reacting with antibodies reactive with
CC   a human HEV strain or natural mutants. The HEV and the proteins can be
CC   used in vaccines for immunising against HEV infection. The swine HEV can
CC   be used in humans to prevent possible infection by human HEV. The swine
CC   HEV can also be used as a therapeutic treatment for infection by other
CC   strains of HEV. The swine HEV can also be used for the production of
CC   antibodies which can be used in therapy, detection and diagnosis. The
CC   products can also be used for determining the susceptibility of cells or
CC   organs to infection with swine HEV. The swine HEV is particularly useful
CC   for the development of agents for the prevention, treatment and detection
CC   of human HEV because it is not a human virus and thus can be handled both
CC   experimentally and clinically without fear of severe infection and/or
CC   contamination

PT   Novel isolated avian hepatitis E virus useful in a vaccine for protecting
PT   an avian or mammalian species from viral infection or hepatitis-
PT   splenomegaly syndrome caused by the avian or mammalian hepatitis E virus.
```

```
XX
PS   Example 11; Fig 5; 95pp; English.
XX
CC   The present invention relates to an isolated avian hepatitis E virus
CC   having the nucleic acid sequence shown in ABT05872. Vaccines against the
CC   virus are also described, and can be used for protecting an avian or
CC   mammalian species from viral infection or hepatitis-splenomegaly syndrome
CC   caused by the avian or mammalian HEV. The present sequence is a hepatitis
CC   E virus protein described in the exemplification of the invention

XX
PS   Claim 1; Page 15-17; 29pp; Japanese.
XX
CC   This sequence represents a Hepatitis E viral hollow particle protein
CC   described as ORF2. This polypeptide can be used to raise antibodies to
CC   detect HEV infection in samples, e.g. by immuno-assay based techniques,
CC   and the nucleic acid can be used for the same in nucleic acid
CC   hybridisation assays. The polypeptide and nucleic acid allow more
CC   accurate detection of HEV than previously possible

XX
PS   Claim 6; Page 13-15; 121pp; English.
XX
CC   The present sequence is the protein prod. of ORF-2 from the hepatitis E
CC   virus (HEV) strain SAR-55, which was implicated in an enterically
CC   transmitted non-A, non-B hepatitis in Pakistan. The protein encoded by
CC   the structural region of the virus (i.e. ORF-2), which is capable of
CC   forming HEV like particles, is useful for the detection of HEV antibodies
CC   (pref. IgG or IgM) in blood, plasma, sera, cerebrospinal fluid, tissue,
CC   urine or pleural fluid. The protein, and anti-HEV antibodies generated
CC   using the protein, can also be used in vaccines for immunising an animal
CC   against HEV infection. The protein is identified as a band of greater
CC   than 50 kD following SDS-PAGE of cell lysates of insect cells infected
CC   with a HEV ORF-2 contg. baculovirus, i.e. the claimed recombinant
CC   expression vectors pPIC9-1779, -1780 and -1781

XX
CC   This invention describes a swine hepatitis E virus (HEV) and its natural
CC   mutants which are capable of cross-reacting with antibodies reactive with
CC   a human HEV strain or natural mutants. The HEV and the proteins can be
CC   used in vaccines for immunising against HEV infection. The swine HEV can
CC   be used in humans to prevent possible infection by human HEV. The swine
CC   HEV can also be used as a therapeutic treatment for infection by other
CC   strains of HEV. The swine HEV can also be used for the production of
CC   antibodies which can be used in therapy, detection and diagnosis. The
CC   products can also be used for determining the susceptibility of cells or
CC   organs to infection with swine HEV. The swine HEV is particularly useful
CC   for the development of agents for the prevention, treatment and detection
CC   of human HEV because it is not a human virus and thus can be handled both
CC   experimentally and clinically without fear of severe infection and/or
CC   contamination

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX
CC A DNA sequence (AAT27110) codes for 62K antigen (AAR96092) comprising the
CC C-terminal 549 amino acids of hepatitis E virus (HEV) Mexico strain
CC capsid protein (AAR96090). It is obtd. by PCR amplification of HEV Mexico
CC ORF-2 (AAT27108). The amplified fragment is inserted into vector pGEX for
CC prodn. 62K in E. coli cells. Expression of full-length ORF-2 in Sf9
CC insect cells using a baculovirus system also results in prodn. of 62K
CC antigen (see also AAR96101 and AAR96103). 62K represents an improved
CC antigen, in comparison to bacterial expressed proteins, for use in HEV
CC diagnostic assays, and also has excellent immunogenic properties.

PS Disclosure; Page 71-72; 125pp; English.
XX
CC The hepatitis E virus (HEV) Mexico strain ORF-2 (AAT27108) codes for the
CC putative capsid protein (AAR96090). PCR amplification of ORF-2 allows
CC prodn. of capsid protein or of C-terminal regions of the capsid protein
CC (see also AAR96092, AAR96094 and AAR96096) and expression in Spodoptera
CC frugiperda Sf9 insect cells using a baculovirus vector provides
CC recombinant C-terminal regions (see also AAR96102 and AAR96104) useful as
CC diagnostic reagents and in vaccines. The HEV Burma strain ORF-2
CC (AAT27107) may similarly be used. (Updated on 16-OCT-2003 to standardise
CC OS field)

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 25-28; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present sequence encodes the protein from the open reading frame,
CC   ORF2, from HEV Mexico strain. The method can be used to diagnose
CC   infection with the enterically transmitted non-A/non-B viral hepatitis
CC   agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-
CC   MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS
CC   field)

PT   New immunogenic hepatitis E virus (HEV) peptide(s) - are from the ORF1,
PT   ORF2 and ORF3 regions of HEV, useful as a vaccine against HEV infection.
XX
PS   Disclosure; Fig 7; 48pp; English.
XX
CC   Immunogenic hepatitis E virus (HEV) peptides are selected from the ORF1,
CC   ORF2 and ORF3 regions of HEV. The peptides can be used in vaccines to
CC   prevent infection by HEV. The antibodies can neutralise and block HEV
CC   infection and can be used to prevent or treat HEV infection. The peptides
CC   and antibodies can also be used as diagnostic reagents. (Updated on 25-
CC   MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS
CC   field)

```
CC   The sequence from a Mexican strain of ET-NANB virus is about 75 per cent
CC   identical to the ET1.1 sequence (see AAQ14410). The Mexican sequence was
CC   identified in a cDNA library made directly from a semi-purified human
CC   stool specimen collected from an outbreak of ET-NANB in Telixtac.
CC   Screening was with a serum considered to have high titer anti-ET-NANB
CC   antibodies. Two clones were identified from a total of 60,000 screened.
CC   The sequence of these clones was subsequently localised to the 3' half of
CC   the viral genome by homology comparison to the Burma strain sequence (see
CC   AAQ14412). (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-
CC   MAR-2003 to correct PI field.) (Updated on 27-AUG-2003 to correct OS
CC   field.)

PT   the virus.
XX
PS   Claim 4; Col 69-76; 47pp; English.
XX
CC   The present sequence represents the composite Mexico strain sequence of
CC   enterically transmitted non A non B hepatitis virus (ET-NANB) (hepatitis
CC   E virus (HEV)). The specification describes an isolated protein which is
CC   specifically immunoreactive with antibodies present in individuals
CC   infected with HEV and encoded by a sequence contained in an open reading
CC   frame (ORF) of an HEV genome. The genome has a sequence that is more than
CC   70% identical to the ORF1 sequence from Burma HEV isolate (AAV66321). The
CC   protein is used as a vaccine and a diagnostic probe for ET-NANB. (Updated
CC   on 25-MAR-2003 to correct PR field.) (Updated on 27-AUG-2003 to correct
CC   OS field.)

CC The present sequence represents the composite sequence of the Mexico
CC strain of an enterically transmitted nonA/nonB viral hepatitis agent (ET-
CC NANB). The nucleic acid sequence may be used for identifying and
CC sequencing the entire viral agent (also referred to as HEV), detecting ET
CC -NANB in infected samples, e.g. by specific amplification of virus-
CC derived DNA sequences and for producing recombinant viral proteins for
CC use in vaccines. (Updated on 25-MAR-2003 to correct PF field.)

PT   Identifying recombinant antigen immunoreactive with antibody induced by
PT   hepatitis E virus (HEV), for detecting HEV infection, comprises
PT   immunoreacting a polypeptide from an HEV genome with an HEV-positive
PT   antiserum.
XX
PS   Claim 5; Col 69-76; 46pp; English.
XX
CC   The present invention describes a method for identifying a recombinant
CC   antigen immunoreactive with a hepatitis E virus (HEV)-induced antibody.
CC   The method comprises producing a polypeptide derived from an HEV genome,
CC   immunoreacting the polypeptide with an HEV-positive antiserum and
CC   selecting the polypeptide as a recombinant antigen if the polypeptide
CC   reacts with the HEV-positive antiserum. The method is useful for
CC   identifying recombinant antigen immunoreactive with antibody induced by
CC   HEV. The enterically transmitted non-A/non-B hepatitis (ET-NANB (also
CC   known as HEV))-specific fragments are useful for identifying ET-NANB-
CC   derived cDNAs, which contain additional sequence information, as primers
CC   for detecting ET-NANB viral genomic material in a patient sample, for the
CC   synthesis of polypeptides for use in immunoassays, and for identifying
CC   similar antigenic regions encoded by related viral strains, e.g. Burmese
CC   strain. The antigens are especially useful in the preparation of vaccine
CC   against ET-NANB infection. These antigens may further be used to prepare
CC   antibodies to ET-NANB virus particles for use directly as antiviral
CC   agents, and to produce antiserum designed for pre- or post-exposure
CC   prophylaxis. The present sequence represents a specifically claimed HEV
CC   composite Mexican strain gene sequence for use in the present invention

XX
CC The invention relates to an isolated DNA comprising the genome of an
CC enterically transmitted nonA/nonB (ET-NANB) viral hepatitis agent (also
CC referred as HEV). The DNA sequences or their fragments are useful in
CC preparing ET-NANB viral proteins and as probes for virus detection. These
CC are particularly useful in diagnosing infection by an enterically
CC transmitted agent (e.g. ET-NANB virus), as well as in vaccine production.
CC The present sequence represents a Mexican strain composite ET-NANB viral
CC cDNA sequence

PT Detecting the presence of enterically transmitted nonA/nonB hepatitis
PT viral (HEV) agents in bile samples from infected humans and monkeys using
PT polymerase chain reaction.
XX
PS Disclosure; Col 25-32; 61pp; English.
XX
CC The invention comprises a method for detecting the presence of
CC enterically transmitted nonA/nonB hepatitis viral (HEV) agents in a
CC sample and isolating HEV agents or nucleic acid fragments produced by the
CC agent. The method utilises PCR - using bile from a human or cynomolgus
CC monkey actively infected with HEV as a source of the agent. The method of
CC the invention is used for detecting the presence of a viral agent in a
CC sample of cultured cells infected with the agent and isolating
CC enterically transmitted nonA/nonB HEV agents or nucleic acid fragments
CC produced by the agent. The present DNA sequence was isolated from a
CC Mexican strain of the Hepatitis E virus

PT   New proteins derived from an enterically transmitted non-A/non-B (ET-
PT   NANB) viral hepatitis agent, useful for diagnosing ET-NANB infection and
PT   producing vaccines for immunizing an individual against ET-NANB hepatitis
PT   viral agent.
XX
PS   Claim 3; SEQ ID NO 10; 81pp; English.
XX
CC   The invention relates to a protein derived from an enterically
CC   transmitted non-A/non-B viral hepatitis agent. The viral proteins are
CC   useful for detecting infection by the enterically transmitted non-A/non-B
CC   (ET-NANB/HEV) hepatitis viral agent. The proteins are also useful for
CC   producing vaccines for immunising an individual against HEV hepatitis
CC   viral agent. The DNA fragments are useful for identifying and sequencing
CC   the entire viral agent and for assaying the viral agent in an infected
CC   sample. The present sequence is used in the exemplification of the
CC   invention.

PS Disclosure; SEQ ID NO 49; 238pp; Japanese.
XX
CC The invention relates to novel polynucleotide probes for detecting
CC hepatitis E virus polynucleotides which contain a sequence of at least 8
CC consecutive nucleotides of the hepatitis E virus genome. The hepatitis E
CC virus genomic sequences are derived from various strains of the Japanese
CC Hepatitis E virus. The probes and primers are applicable in chips and
CC kits for detecting hepatitis E virus and its infection. This sequence
CC represents the genomic sequence from the Hepatitis E virus strain Mexico.

PT   Antigen and antibody vaccines against hepatitis E virus infection -
PT   contain peptide(s) derived from capsid protein C-terminal or antibodies
PT   against protein.
XX
PS   Disclosure; Fig 7; 43pp; English.
XX
CC   The sequence is that encoding Mexico strain hepatitis E virus (HEV) open
CC   reading frames ORF2 and ORF3. ORF2 encodes the putative capsid protein of
CC   the virus, this protein or peptide fragments of it may be used in a
CC   vaccine composition for immunising an individual against HEV. Antibodies
CC   raised against these peptides can also be used in such vaccines. (Updated
CC   on 25-MAR-2003 to correct PN field.)

PT Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids
PT encoding it - useful for more accurate detection of HEV in samples, using
PT immuno-assays and nucleic acid hybridisation.
XX
PS Claim 1; Page 15-17; 29pp; Japanese.
XX
CC This sequence encodes a Hepatitis E viral hollow particle protein
CC described as ORF2. This polypeptide can be used to raise antibodies to
CC detect HEV infection in samples, e.g. by immuno-assay based techniques,
CC and the nucleic acid can be used for the same in nucleic acid
CC hybridisation assays. The polypeptide and nucleic acid allow more
CC accurate detection of HEV than previously possible

XX
PT   Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids
```

PT encoding it - useful for more accurate detection of HEV in samples, using
PT immuno-assays and nucleic acid hybridisation.
XX
PS Claim 13; Page 24-26; 29pp; Japanese.
XX
CC This sequence encodes a Hepatitis E viral hollow particle protein. This
CC polypeptide can be used to raise antibodies to detect HEV infection in
CC samples, e.g. by immuno-assay based techniques, and the nucleic acid can
CC be used for the same in nucleic acid hybridisation assays. The
CC polypeptides and nucleic acids allow more accurate detection of HEV than
CC previously possible
XX

CC   -!- FUNCTION: Contains a high basic amino acid content suggesting that
CC       it may be involved in the encapsidation of the genomic RNA by
CC       effectively neutralizing the negatively charged RNA.

PT Hepatitis E virus (HEV) antigens derived from ORF 2 - useful as
PT diagnostic reagents for determining HEV infection and in vaccines.
XX
PS Claim 5; Page 92-93; 125pp; English.
XX
CC DNA (AAT27109) coding for the 62K antigen (AAR96091) of hepatitis E virus
CC (HEV) Burma strain capsid protein was cloned into baculovirus expression
CC vector pBluBacIII and recombinant 62K was expressed in Sf9 insect cells.
CC High levels of expression were obtd. and the recombinant 62K was obtd. in
CC over 95% purity. However, C-terminal processing resulted in the deletion
CC of 9 or 23 amino acids from 62K, giving 2 related polypeptide species
CC (AAR96101 and AAR96103). Similar results were obtd. with HEV Mexico 62K
CC antigen (see also AAR96102 and AAR96104). Recombinant 62K represents an
CC improved antigen, in comparison to bacterial expressed proteins, for use
CC in HEV diagnostic assays, and also has excellent immunogenic properties.
CC (Updated on 16-OCT-2003 to standardise OS field)

PS   Claim 3; Page 83-84; 125pp; English.
XX
CC   62K antigen (AAR96091) comprises the C-terminal 549 amino acids of
CC   hepatitis E virus (HEV) Burma strain capsid protein (see also AAR96089).
CC   It is obtd. by PCR amplification of HEV Burma ORF-2 (AAT27107), insertion
CC   of amplified DNA (AAT27109) into vector pGEX and expression in E. coli
CC   cells. Expression of full-length ORF-2 in Sf9 insect cells using a
CC   baculovirus system also results in prodn. of 62K antigen (see also
CC   AAR96101 and AAR96103). 62K represents an improved antigen, in comparison
CC   to bacterial expressed proteins, for use in HEV diagnostic assays, and
CC   also has excellent immunogenic properties. (Updated on 16-OCT-2003 to
CC   standardise OS field)

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 39-42; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present sequence represents the protein from the open reading
CC   frame, ORF2, from HEV Burma strain. The method can be used to diagnose
CC   infection with the enterically transmitted non-A/non-B viral hepatitis
CC   agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-
CC   MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS
CC   field)

XX
CC   AAW80196-98 are encoded by the genome of the Burma strain of enterically
CC   transmitted non A non B hepatitis virus (ET-NANB) (hepatitis E virus
CC   (HEV)). The specification describes an isolated protein which is
CC   specifically immunoreactive with antibodies present in individuals
CC   infected with HEV and encoded by a sequence contained in an open reading
CC   frame (ORF) of an HEV genome. The genome has a sequence that is more than
CC   70% identical to the ORF1 sequence from Burma HEV isolate. The protein is
CC   used as a vaccine and a diagnostic probe for ET-NANB. (Updated on 25-MAR-
CC   2003 to correct PR field.) (Updated on 27-AUG-2003 to correct OS field.)

PT New isolated swine hepatitis E virus - used to develop products for the
PT diagnosis, prevention and treatment of hepatitis E virus infection in
PT mammals, particularly humans.
XX
PS Example 1; Fig 3A; 70pp; English.
XX
CC This invention describes a swine hepatitis E virus (HEV) and its natural
CC mutants which are capable of cross-reacting with antibodies reactive with
CC a human HEV strain or natural mutants. The HEV and the proteins can be
CC used in vaccines for immunising against HEV infection. The swine HEV can
CC be used in humans to prevent possible infection by human HEV. The swine
CC HEV can also be used as a therapeutic treatment for infection by other
CC strains of HEV. The swine HEV can also be used for the production of
CC antibodies which can be used in therapy, detection and diagnosis. The
CC products can also be used for determining the susceptibility of cells or
CC organs to infection with swine HEV. The swine HEV is particularly useful
CC for the development of agents for the prevention, treatment and detection
CC of human HEV because it is not a human virus and thus can be handled both
CC experimentally and clinically without fear of severe infection and/or
CC contamination

PT   Identifying recombinant antigen immunoreactive with antibody induced by
PT   hepatitis E virus (HEV), for detecting HEV infection, comprises
PT   immunoreacting a polypeptide from an HEV genome with an HEV-positive
PT   antiserum.
XX
PS   Claim 6; Col 63-68; 46pp; English.
XX
CC   The present invention describes a method for identifying a recombinant
CC   antigen immunoreactive with a hepatitis E virus (HEV)-induced antibody.
CC   The method comprises producing a polypeptide derived from an HEV genome,
CC   immunoreacting the polypeptide with an HEV-positive antiserum and
CC   selecting the polypeptide as a recombinant antigen if the polypeptide
CC   reacts with the HEV-positive antiserum. The method is useful for
CC   identifying recombinant antigen immunoreactive with antibody induced by
CC   HEV. The enterically transmitted non-A/non-B hepatitis (ET-NANB (also
CC   known as HEV))-specific fragments are useful for identifying ET-NANB-
CC   derived cDNAs, which contain additional sequence information, as primers
CC   for detecting ET-NANB viral genomic material in a patient sample, for the
CC   synthesis of polypeptides for use in immunoassays, and for identifying
CC   similar antigenic regions encoded by related viral strains, e.g. Burmese
CC   strain. The antigens are especially useful in the preparation of vaccine
CC   against ET-NANB infection. These antigens may further be used to prepare
CC   antibodies to ET-NANB virus particles for use directly as antiviral
CC   agents, and to produce antiserum designed for pre- or post-exposure
CC   prophylaxis. The present sequence represents a specifically claimed HEV
CC   Burma strain protein sequence for use in the present invention

XX
CC   The invention relates to an isolated DNA comprising the genome of an
CC   enterically transmitted nonA/nonB (ET-NANB) viral hepatitis agent (also
CC   referred as HEV). The DNA sequences or their fragments are useful in
CC   preparing ET-NANB viral proteins and as probes for virus detection. These
CC   are particularly useful in diagnosing infection by an enterically
CC   transmitted agent (e.g. ET-NANB virus), as well as in vaccine production.
CC   The present sequence represents a ORF2 protein encoded by a ET-NANB viral
CC   DNA sequence from HEV-Burma strain

PT Detecting the presence of enterically transmitted nonA/nonB hepatitis
PT viral (HEV) agents in bile samples from infected humans and monkeys using
PT polymerase chain reaction.
XX
PS Disclosure; Col 19-24; 61pp; English.
XX
CC The invention comprises a method for detecting the presence of
CC enterically transmitted nonA/nonB hepatitis viral (HEV) agents in a
CC sample and isolating HEV agents or nucleic acid fragments produced by the
CC agent. The method utilises PCR - using bile from a human or cynomolgus
CC monkey actively infected with HEV as a source of the agent. The method of
CC the invention is used for detecting the presence of a viral agent in a
CC sample of cultured cells infected with the agent and isolating
CC enterically transmitted nonA/nonB HEV agents or nucleic acid fragments
CC produced by the agent. The present amino acid sequence represents the
CC protein encoded by open reading frame 2 (ORF2) of a DNA sequence isolated
CC from a Burmese strain of the Hepatitis E virus

PT   New proteins derived from an enterically transmitted non-A/non-B (ET-
PT   NANB) viral hepatitis agent, useful for diagnosing ET-NANB infection and
PT   producing vaccines for immunizing an individual against ET-NANB hepatitis
PT   viral agent.
XX
PS   Disclosure; SEQ ID NO 8; 81pp; English.
XX
CC   The invention relates to a protein derived from an enterically
CC   transmitted non-A/non-B viral hepatitis agent. The viral proteins are
CC   useful for detecting infection by the enterically transmitted non-A/non-B
CC   (ET-NANB/HEV) hepatitis viral agent. The proteins are also useful for
CC   producing vaccines for immunising an individual against HEV hepatitis
CC   viral agent. The DNA fragments are useful for identifying and sequencing
CC   the entire viral agent and for assaying the viral agent in an infected
CC   sample. The present sequence is used in the exemplification of the
CC   invention.

PT   Hepatitis E virus DNA - useful for e.g. virus detection and viral protein
PT   production.
XX
PS   Disclosure; Col 63-68; 45pp; English.
XX
CC   AAW71209-11 represent the proteins encoded by the open reading frames
CC   (ORFs) of the DNA sequence of the Burmese isolate of an enterically
CC   transmitted nonA/nonB viral hepatitis agent (ET-NANB). The nucleic acid
CC   sequence may be used for identifying and sequencing the entire viral
CC   agent (also referred to as HEV), detecting ET-NANB in infected samples,
CC   e.g. by specific amplification of virus-derived DNA sequences and for
CC   producing recombinant viral proteins for use in vaccines. (Updated on 25-
CC   MAR-2003 to correct PF field.)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC   -!- FUNCTION: Contains a high basic amino acid content suggesting that
CC       it may be involved in the encapsidation of the genomic RNA by
CC       effectively neutralizing the negatively charged RNA.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Hepatitis E virus (HEV) antigens derived from ORF 2 - useful as
PT diagnostic reagents for determining HEV infection and in vaccines.
XX
PS Claim 6; Page 93-95; 125pp; English.
XX
CC DNA (AAT27110) coding for the 62K antigen (AAR96092) of hepatitis E virus
CC (HEV) Mexico strain capsid protein was cloned into baculovirus expression
CC vector pBluBacIII and recombinant 62K was expressed in Sf9 insect cells.
CC High levels of expression were obtd. and the recombinant 62K was obtd. in
CC over 95% purity. However, C-terminal processing resulted in the deletion
CC of 9 or 23 amino acids from 62K, giving 2 related polypeptide species
CC (AAR96102 and AAR96104). Similar results were obtd. with HEV Burma 62K
CC antigen (see also AAR96101 and AAR96103). Recombinant 62K represents an
CC improved antigen, in comparison to bacterial expressed proteins, for use
CC in HEV diagnostic assays, and also has excellent immunogenic properties.
CC (Updated on 16-OCT-2003 to standardise OS field)

XX
PS Claim 4; Page 84-86; 125pp; English.
XX
CC 62K antigen (AAR96092) comprises the C-terminal 549 amino acids of
CC hepatitis E virus (HEV) Mexico strain capsid protein (see also AAR96090).
CC It is obtd. by PCR amplification of HEV Mexico ORF-2 (AAT27108),
CC insertion of amplified DNA (AAT27110) into vector pGEX and expression in
CC E. coli cells. Expression of full-length ORF-2 in Sf9 insect cells using
CC a baculovirus system also results in prodn. of 62K antigen (see also
CC AAR96102 and AAR96104). 62K represents an improved antigen, in comparison
CC to bacterial expressed proteins, for use in HEV diagnostic assays, and
CC also has excellent immunogenic properties. (Updated on 16-OCT-2003 to
CC standardise OS field)

PT Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT immunoassay with hepatitis E virus peptide antigens.
XX
PS Disclosure; Col 43-46; 36pp; English.
XX
CC A method has been developed for detecting hepatitis E virus (HEV)
CC antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC HEV peptide antigen; and (b) examining the peptide for the presence of
CC bound Ab, where the presence of bound Ab indicates the presence of HEV
CC Ab. The present sequence represents the protein from the open reading
CC frame, ORF2, from HEV Mexico strain. The method can be used to diagnose
CC infection with the enterically transmitted non-A/non-B viral hepatitis
CC agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-
CC MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS
CC field)

PT New isolated swine hepatitis E virus - used to develop products for the
PT diagnosis, prevention and treatment of hepatitis E virus infection in
PT mammals, particularly humans.
XX
PS Example 1; Fig 3A; 70pp; English.
XX
CC This invention describes a swine hepatitis E virus (HEV) and its natural
CC mutants which are capable of cross-reacting with antibodies reactive with
CC a human HEV strain or natural mutants. The HEV and the proteins can be
CC used in vaccines for immunising against HEV infection. The swine HEV can
CC be used in humans to prevent possible infection by human HEV. The swine
CC HEV can also be used as a therapeutic treatment for infection by other
CC strains of HEV. The swine HEV can also be used for the production of
CC antibodies which can be used in therapy, detection and diagnosis. The
CC products can also be used for determining the susceptibility of cells or
CC organs to infection with swine HEV. The swine HEV is particularly useful
CC for the development of agents for the prevention, treatment and detection
CC of human HEV because it is not a human virus and thus can be handled both
CC experimentally and clinically without fear of severe infection and/or
CC contamination

PT Antigen and antibody vaccines against hepatitis E virus infection -
PT contain peptide(s) derived from capsid protein C-terminal or antibodies
PT against protein.
XX
PS Disclosure; Fig 7; 43pp; English.
XX
CC The sequence is that of the putative virus capsid protein encoded by
CC Mexico strain hepatitis E virus (HEV) open reading frame ORF2. This
CC protein or peptide fragments of it may be used in a vaccine composition
CC for immunising an individual against HEV. Antibodies raised against these
CC peptides can also be used in such vaccines. (Updated on 25-MAR-2003 to
CC correct PN field.)

XX
PS Claim 8; Page 97-98; 125pp; English.
XX
CC DNA (AAT27110) coding for the 62K antigen (AAR96092) of hepatitis E virus
CC (HEV) Mexico strain capsid protein was cloned into baculovirus expression

```
CC   vector pBluBacIII and recombinant 62K was expressed in Sf9 insect cells.
CC   High levels of expression were obtd. and the recombinant 62K was obtd. in
CC   over 95% purity. However, C-terminal processing resulted in the deletion
CC   of 9 or 23 amino acids from 62K, giving 2 related polypeptide species
CC   (AAR96102 and AAR96104). Similar results were obtd. with HEV Burma 62K
CC   antigen (see also AAR96101 and AAR96103). Recombinant 62K represents an
CC   improved antigen, in comparison to bacterial expressed proteins, for use
CC   in HEV diagnostic assays, and also has excellent immunogenic properties.

PT   Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids
PT   encoding it - useful for more accurate detection of HEV in samples, using
PT   immuno-assays and nucleic acid hybridisation.
XX
PS   Claim 1; Page 15-17; 29pp; Japanese.
XX
CC   This sequence represents a Hepatitis E viral hollow particle protein
CC   described as ORF2. This polypeptide can be used to raise antibodies to
CC   detect HEV infection in samples, e.g. by immuno-assay based techniques,
CC   and the nucleic acid can be used for the same in nucleic acid
CC   hybridisation assays. The polypeptide and nucleic acid allow more
CC   accurate detection of HEV than previously possible

PT Isolated and purified hepatitis E virus strain SAR-55 DNA - encodes
PT antigenic protein useful in diagnosis, prophylaxis and treatment of
PT hepatitis E virus infection.
XX
PS Claim 6; Page 13-15; 121pp; English.
XX
CC The present sequence is the protein prod. of ORF-2 from the hepatitis E
CC virus (HEV) strain SAR-55, which was implicated in an enterically
CC transmitted non-A, non-B hepatitis in Pakistan. The protein encoded by
CC the structural region of the virus (i.e. ORF-2), which is capable of
CC forming HEV like particles, is useful for the detection of HEV antibodies
CC (pref. IgG or IgM) in blood, plasma, sera, cerebrospinal fluid, tissue,
CC urine or pleural fluid. The protein, and anti-HEV antibodies generated
CC using the protein, can also be used in vaccines for immunising an animal
CC against HEV infection. The protein is identified as a band of greater
CC than 50 kD following SDS-PAGE of cell lysates of insect cells infected
CC with a HEV ORF-2 contg. baculovirus, i.e. the claimed recombinant
CC expression vectors pPIC9-1779, -1780 and -1781

PT New isolated swine hepatitis E virus - used to develop products for the

PT diagnosis, prevention and treatment of hepatitis E virus infection in
PT mammals, particularly humans.
XX
PS Example 1; Fig 3A; 70pp; English.
XX
CC This invention describes a swine hepatitis E virus (HEV) and its natural
CC mutants which are capable of cross-reacting with antibodies reactive with
CC a human HEV strain or natural mutants. The HEV and the proteins can be
CC used in vaccines for immunising against HEV infection. The swine HEV can
CC be used in humans to prevent possible infection by human HEV. The swine
CC HEV can also be used as a therapeutic treatment for infection by other
CC strains of HEV. The swine HEV can also be used for the production of
CC antibodies which can be used in therapy, detection and diagnosis. The
CC products can also be used for determining the susceptibility of cells or
CC organs to infection with swine HEV. The swine HEV is particularly useful
CC for the development of agents for the prevention, treatment and detection
CC of human HEV because it is not a human virus and thus can be handled both
CC experimentally and clinically without fear of severe infection and/or
CC contamination

PT New isolated swine hepatitis E virus - used to develop products for the
PT diagnosis, prevention and treatment of hepatitis E virus infection in
PT mammals, particularly humans.
XX
PS Example 1; Fig 3A; 70pp; English.
XX
CC This invention describes a swine hepatitis E virus (HEV) and its natural
CC mutants which are capable of cross-reacting with antibodies reactive with
CC a human HEV strain or natural mutants. The HEV and the proteins can be
CC used in vaccines for immunising against HEV infection. The swine HEV can
CC be used in humans to prevent possible infection by human HEV. The swine
CC HEV can also be used as a therapeutic treatment for infection by other
CC strains of HEV. The swine HEV can also be used for the production of
CC antibodies which can be used in therapy, detection and diagnosis. The
CC products can also be used for determining the susceptibility of cells or
CC organs to infection with swine HEV. The swine HEV is particularly useful
CC for the development of agents for the prevention, treatment and detection
CC of human HEV because it is not a human virus and thus can be handled both
CC experimentally and clinically without fear of severe infection and/or
CC contamination

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX
PS Claim 7; Page 95-97; 125pp; English.
XX
CC DNA (AAT27109) coding for the 62K antigen (AAR96091) of hepatitis E virus
CC (HEV) Burma strain capsid protein was cloned into baculovirus expression
CC vector pBluBacIII and recombinant 62K was expressed in Sf9 insect cells.
CC High levels of expression were obtd. and the recombinant 62K was obtd. in
CC over 95% purity. However, C-terminal processing resulted in the deletion
CC of 9 or 23 amino acids from 62K, giving 2 related polypeptide species
CC (AAR96101 and AAR96103). Similar results were obtd. with HEV Mexico 62K
CC antigen (see also AAR96102 and AAR96104). Recombinant 62K represents an
CC improved antigen, in comparison to bacterial expressed proteins, for use
CC in HEV diagnostic assays, and also has excellent immunogenic properties.
CC (Updated on 16-OCT-2003 to standardise OS field)

XX
CC   62K antigen (AAR96091) comprises the C-terminal 549 amino acids of
CC   hepatitis E virus (HEV) Burma strain capsid protein (see also AAR96089).
CC   It is obtd. by PCR amplification of HEV Burma ORF-2 (AAT27107), insertion
CC   of amplified DNA (AAT27109) into vector pGEX and expression in E. coli
CC   cells. Expression of full-length ORF-2 in Sf9 insect cells using a
CC   baculovirus system also results in prodn. of 62K antigen (see also
CC   AAR96101 and AAR96103). 62K represents an improved antigen, in comparison
CC   to bacterial expressed proteins, for use in HEV diagnostic assays, and
CC   also has excellent immunogenic properties. (Updated on 16-OCT-2003 to
CC   standardise OS field)

PT   New immunogenic hepatitis E virus (HEV) peptide(s) - are from the ORF1,
PT   ORF2 and ORF3 regions of HEV, useful as a vaccine against HEV infection.
XX
PS   Disclosure; Fig 8; 48pp; English.
XX
CC   Immunogenic hepatitis E virus (HEV) peptides are selected from the ORF1,
CC   ORF2 and ORF3 regions of HEV. The peptides can be used in vaccines to
CC   prevent infection by HEV. The antibodies can neutralise and block HEV
CC   infection and can be used to prevent or treat HEV infection. The peptides
CC   and antibodies can also be used as diagnostic reagents. (Updated on 25-
CC   MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS
CC   field)

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 39-42; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present sequence represents the protein from the open reading
CC   frame, ORF2, from HEV Burma strain. The method can be used to diagnose
CC   infection with the enterically transmitted non-A/non-B viral hepatitis
CC   agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-
CC   MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS
CC   field)

PT the virus.
XX
PS Claim 6; Col 65-70; 47pp; English.
XX
CC AAW80196-98 are encoded by the genome of the Burma strain of enterically
CC transmitted non A non B hepatitis virus (ET-NANB) (hepatitis E virus
CC (HEV)). The specification describes an isolated protein which is
CC specifically immunoreactive with antibodies present in individuals
CC infected with HEV and encoded by a sequence contained in an open reading
CC frame (ORF) of an HEV genome. The genome has a sequence that is more than
CC 70% identical to the ORF1 sequence from Burma HEV isolate. The protein is
CC used as a vaccine and a diagnostic probe for ET-NANB. (Updated on 25-MAR-
CC 2003 to correct PR field.) (Updated on 27-AUG-2003 to correct OS field.)

XX
CC   This invention describes a swine hepatitis E virus (HEV) and its natural
CC   mutants which are capable of cross-reacting with antibodies reactive with
CC   a human HEV strain or natural mutants. The HEV and the proteins can be
CC   used in vaccines for immunising against HEV infection. The swine HEV can
CC   be used in humans to prevent possible infection by human HEV. The swine
CC   HEV can also be used as a therapeutic treatment for infection by other
CC   strains of HEV. The swine HEV can also be used for the production of
CC   antibodies which can be used in therapy, detection and diagnosis. The
CC   products can also be used for determining the susceptibility of cells or
CC   organs to infection with swine HEV. The swine HEV is particularly useful
CC   for the development of agents for the prevention, treatment and detection
CC   of human HEV because it is not a human virus and thus can be handled both
CC   experimentally and clinically without fear of severe infection and/or
CC   contamination

PT   Identifying recombinant antigen immunoreactive with antibody induced by
PT   hepatitis E virus (HEV), for detecting HEV infection, comprises
PT   immunoreacting a polypeptide from an HEV genome with an HEV-positive
PT   antiserum.
XX
PS   Claim 6; Col 63-68; 46pp; English.
XX
CC   The present invention describes a method for identifying a recombinant
CC   antigen immunoreactive with a hepatitis E virus (HEV)-induced antibody.
CC   The method comprises producing a polypeptide derived from an HEV genome,
CC   immunoreacting the polypeptide with an HEV-positive antiserum and
CC   selecting the polypeptide as a recombinant antigen if the polypeptide
CC   reacts with the HEV-positive antiserum. The method is useful for
CC   identifying recombinant antigen immunoreactive with antibody induced by
CC   HEV. The enterically transmitted non-A/non-B hepatitis (ET-NANB (also
CC   known as HEV))-specific fragments are useful for identifying ET-NANB-
CC   derived cDNAs, which contain additional sequence information, as primers
CC   for detecting ET-NANB viral genomic material in a patient sample, for the
CC   synthesis of polypeptides for use in immunoassays, and for identifying
CC   similar antigenic regions encoded by related viral strains, e.g. Burmese
CC   strain. The antigens are especially useful in the preparation of vaccine
CC   against ET-NANB infection. These antigens may further be used to prepare
CC   antibodies to ET-NANB virus particles for use directly as antiviral
CC   agents, and to produce antiserum designed for pre- or post-exposure
CC   prophylaxis. The present sequence represents a specifically claimed HEV
CC   Burma strain protein sequence for use in the present invention

PT   Detecting the presence of enterically transmitted nonA/nonB hepatitis
PT   viral (HEV) agents in bile samples from infected humans and monkeys using
PT   polymerase chain reaction.
XX
PS   Disclosure; Col 19-24; 61pp; English.
XX
CC   The invention comprises a method for detecting the presence of
CC   enterically transmitted nonA/nonB hepatitis viral (HEV) agents in a
CC   sample and isolating HEV agents or nucleic acid fragments produced by the
CC   agent. The method utilises PCR - using bile from a human or cynomolgus
CC   monkey actively infected with HEV as a source of the agent. The method of
CC   the invention is used for detecting the presence of a viral agent in a
CC   sample of cultured cells infected with the agent and isolating
CC   enterically transmitted nonA/nonB HEV agents or nucleic acid fragments
CC   produced by the agent. The present amino acid sequence represents the
CC   protein encoded by open reading frame 2 (ORF2) of a DNA sequence isolated
CC   from a Burmese strain of the Hepatitis E virus

PT   New proteins derived from an enterically transmitted non-A/non-B (ET-
PT   NANB) viral hepatitis agent, useful for diagnosing ET-NANB infection and
PT   producing vaccines for immunizing an individual against ET-NANB hepatitis
PT   viral agent.
XX
PS   Disclosure; SEQ ID NO 8; 81pp; English.
XX
CC   The invention relates to a protein derived from an enterically
CC   transmitted non-A/non-B viral hepatitis agent. The viral proteins are
CC   useful for detecting infection by the enterically transmitted non-A/non-B
CC   (ET-NANB/HEV) hepatitis viral agent. The proteins are also useful for
CC   producing vaccines for immunising an individual against HEV hepatitis
CC   viral agent. The DNA fragments are useful for identifying and sequencing
CC   the entire viral agent and for assaying the viral agent in an infected
CC   sample. The present sequence is used in the exemplification of the
CC   invention.

PT Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids
PT encoding it - useful for more accurate detection of HEV in samples, using
PT immuno-assays and nucleic acid hybridisation.
XX
PS Claim 1; Page 15-17; 29pp; Japanese.
XX
CC This sequence represents a Hepatitis E viral hollow particle protein
CC described as ORF2. This polypeptide can be used to raise antibodies to
CC detect HEV infection in samples, e.g. by immuno-assay based techniques,
CC and the nucleic acid can be used for the same in nucleic acid
CC hybridisation assays. The polypeptide and nucleic acid allow more
CC accurate detection of HEV than previously possible

CC   -!- FUNCTION: Contains a high basic amino acid content suggesting that
CC       it may be involved in the encapsidation of the genomic RNA by
CC       effectively neutralizing the negatively charged RNA.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Hepatitis E virus (HEV) antigens derived from ORF 2 - useful as
PT diagnostic reagents for determining HEV infection and in vaccines.
XX
PS Claim 8; Page 97-98; 125pp; English.
XX
CC DNA (AAT27110) coding for the 62K antigen (AAR96092) of hepatitis E virus
CC (HEV) Mexico strain capsid protein was cloned into baculovirus expression
CC vector pBluBacIII and recombinant 62K was expressed in Sf9 insect cells.
CC High levels of expression were obtd. and the recombinant 62K was obtd. in
CC over 95% purity. However, C-terminal processing resulted in the deletion
CC of 9 or 23 amino acids from 62K, giving 2 related polypeptide species
CC (AAR96102 and AAR96104). Similar results were obtd. with HEV Burma 62K
CC antigen (see also AAR96101 and AAR96103). Recombinant 62K represents an
CC improved antigen, in comparison to bacterial expressed proteins, for use
CC in HEV diagnostic assays, and also has excellent immunogenic properties.
CC (Updated on 16-OCT-2003 to standardise OS field)

PS   Claim 4; Page 84-86; 125pp; English.
XX
CC   62K antigen (AAR96092) comprises the C-terminal 549 amino acids of
CC   hepatitis E virus (HEV) Mexico strain capsid protein (see also AAR96090).
CC   It is obtd. by PCR amplification of HEV Mexico ORF-2 (AAT27108),
CC   insertion of amplified DNA (AAT27110) into vector pGEX and expression in
CC   E. coli cells. Expression of full-length ORF-2 in Sf9 insect cells using
CC   a baculovirus system also results in prodn. of 62K antigen (see also
CC   AAR96102 and AAR96104). 62K represents an improved antigen, in comparison
CC   to bacterial expressed proteins, for use in HEV diagnostic assays, and
CC   also has excellent immunogenic properties. (Updated on 16-OCT-2003 to
CC   standardise OS field)

PT   Hepatitis E virus (HEV) antigens derived from ORF 2 - useful as
PT   diagnostic reagents for determining HEV infection and in vaccines.
XX
PS   Disclosure; Page 80-82; 125pp; English.
XX
CC   The putative capsid protein (AAR96090) of hepatitis E virus (HEV) Mexico
CC   strain is encoded by ORF-2 (AAT27108) of the virus. PCR amplification of
CC   ORF-2 allows prodn. of capsid protein or of C-terminal regions of the
CC   capsid protein (see also AAR96092, AAR96094 and AAR96096) and expression
CC   in Spodoptera frugiperda Sf9 insect cells using a baculovirus vector
CC   provides recombinant C-terminal regions (see also AAR96102 and AAR96104)
CC   useful as diagnostic reagents and in vaccines. The HEV Burma strain
CC   capsid protein (AAR96089) may similarly be used. (Updated on 16-OCT-2003
CC   to standardise OS field)

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 43-46; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present sequence represents the protein from the open reading
CC   frame, ORF2, from HEV Mexico strain. The method can be used to diagnose
CC   infection with the enterically transmitted non-A/non-B viral hepatitis
CC   agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-
CC   MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS
CC   field)

PT   New isolated swine hepatitis E virus - used to develop products for the
PT   diagnosis, prevention and treatment of hepatitis E virus infection in
PT   mammals, particularly humans.
XX
PS   Example 1; Fig 3A; 70pp; English.
XX
CC   This invention describes a swine hepatitis E virus (HEV) and its natural
CC   mutants which are capable of cross-reacting with antibodies reactive with
CC   a human HEV strain or natural mutants. The HEV and the proteins can be
CC   used in vaccines for immunising against HEV infection. The swine HEV can
CC   be used in humans to prevent possible infection by human HEV. The swine
CC   HEV can also be used as a therapeutic treatment for infection by other
CC   strains of HEV. The swine HEV can also be used for the production of
CC   antibodies which can be used in therapy, detection and diagnosis. The
CC   products can also be used for determining the susceptibility of cells or
CC   organs to infection with swine HEV. The swine HEV is particularly useful
CC   for the development of agents for the prevention, treatment and detection
CC   of human HEV because it is not a human virus and thus can be handled both
CC   experimentally and clinically without fear of severe infection and/or
CC   contamination

PT Novel isolated avian hepatitis E virus useful in a vaccine for protecting
PT an avian or mammalian species from viral infection or hepatitis-
PT splenomegaly syndrome caused by the avian or mammalian hepatitis E virus.

```
XX
PS   Example 11; Fig 5; 95pp; English.
XX
CC   The present invention relates to an isolated avian hepatitis E virus
CC   having the nucleic acid sequence shown in ABT05872. Vaccines against the
CC   virus are also described, and can be used for protecting an avian or
CC   mammalian species from viral infection or hepatitis-splenomegaly syndrome
CC   caused by the avian or mammalian HEV. The present sequence is a hepatitis
CC   E virus protein described in the exemplification of the invention

XX
PS   Claim 1; Page 15-17; 29pp; Japanese.
XX
CC   This sequence represents a Hepatitis E viral hollow particle protein
CC   described as ORF2. This polypeptide can be used to raise antibodies to
CC   detect HEV infection in samples, e.g. by immuno-assay based techniques,
CC   and the nucleic acid can be used for the same in nucleic acid
CC   hybridisation assays. The polypeptide and nucleic acid allow more
CC   accurate detection of HEV than previously possible

XX
CC   RNA from an HEV strain isolated in the Xinjiang region of China was
CC   subjected to RT-PCR to obtain fragments corresp. to ORF2 (given in
CC   AAQ86592) and ORF3 (AAQ86593) that encoded antigenic proteins (AAR70323-
CC   24, respectively). DNA fragments were manipulated into pGEX vectors for
CC   production of GST fusion proteins in E. coli. Applications include HEV
CC   infection diagnosis, therapy and vaccine development. (Updated on 25-MAR-
CC   2003 to correct PN field.)

PT   Isolated and purified hepatitis E virus strain SAR-55 DNA - encodes
PT   antigenic protein useful in diagnosis, prophylaxis and treatment of
PT   hepatitis E virus infection.
XX
PS   Claim 6; Page 13-15; 121pp; English.
XX
CC   The present sequence is the protein prod. of ORF-2 from the hepatitis E
CC   virus (HEV) strain SAR-55, which was implicated in an enterically
CC   transmitted non-A, non-B hepatitis in Pakistan. The protein encoded by
CC   the structural region of the virus (i.e. ORF-2), which is capable of
CC   forming HEV like particles, is useful for the detection of HEV antibodies
CC   (pref. IgG or IgM) in blood, plasma, sera, cerebrospinal fluid, tissue,
CC   urine or pleural fluid. The protein, and anti-HEV antibodies generated
CC   using the protein, can also be used in vaccines for immunising an animal
CC   against HEV infection. The protein is identified as a band of greater
CC   than 50 kD following SDS-PAGE of cell lysates of insect cells infected
CC   with a HEV ORF-2 contg. baculovirus, i.e. the claimed recombinant
CC   expression vectors pPIC9-1779, -1780 and -1781

PT   New isolated swine hepatitis E virus - used to develop products for the
```

```
PT   diagnosis, prevention and treatment of hepatitis E virus infection in
PT   mammals, particularly humans.
XX
PS   Example 1; Fig 3A; 70pp; English.
XX
CC   This invention describes a swine hepatitis E virus (HEV) and its natural
CC   mutants which are capable of cross-reacting with antibodies reactive with
CC   a human HEV strain or natural mutants. The HEV and the proteins can be
CC   used in vaccines for immunising against HEV infection. The swine HEV can
CC   be used in humans to prevent possible infection by human HEV. The swine
CC   HEV can also be used as a therapeutic treatment for infection by other
CC   strains of HEV. The swine HEV can also be used for the production of
CC   antibodies which can be used in therapy, detection and diagnosis. The
CC   products can also be used for determining the susceptibility of cells or
CC   organs to infection with swine HEV. The swine HEV is particularly useful
CC   for the development of agents for the prevention, treatment and detection
CC   of human HEV because it is not a human virus and thus can be handled both
CC   experimentally and clinically without fear of severe infection and/or
CC   contamination

CC   -!- FUNCTION: Contains a high basic amino acid content suggesting that
CC       it may be involved in the encapsidation of the genomic RNA by
CC       effectively neutralizing the negatively charged RNA.
